

Equilibre d'un corps pur sous plusieurs phases

T1 – Chapitre 3

I. Les changements de phases

II. Diagramme (P, T)

III. Equilibres de phases d'un corps pur

	1 phase	2 phases	3 phases
Equilibres		$X(\alpha) = X(\beta)$ α plus condensé que β	$X(s) = X(l)$ $X(s) = X(g)$ $X(l) = X(g)$
Relations		$g_\alpha(T, P) = g_\beta(T, P)$	$g_s = g_l$ $g_s = g_g$ $g_l = g_g$
Equilibré décrit par	Plan $g(T, P)$	Courbe de saturation $P_{\alpha\beta}(T)$	Point triple Y

IV. Transitions de première espèce

1. Formules

Enthalpie de transition : $l_{1 \rightarrow 2} = \Delta h_{1 \rightarrow 2}$ $l_{1 \rightarrow 2} = -l_{2 \rightarrow 1}$ $s_2 - s_1 = \frac{l_{1 \rightarrow 2}(T_0)}{T_0}$ à $T = T_0$

Relation de Clapeyron : $l_{1 \rightarrow 2} = T(v_2 - v_1) \frac{dP_{12}}{dT}$ $\frac{dP_{12}}{dT}$: pente de la courbe de transition de phases

Propriétés du point triple : $l_f(T_Y) + l_v(T_Y) - l_s(T_Y) = 0$ et $\left(\frac{dP_s}{dT}\right)_Y > \left(\frac{dP_v}{dT}\right)_Y$

2. Compression isotherme à $T = T_0$

3. Echauffement isobare à $P = P_0$

4. Diagramme (P, V)

$$x = x_g = \frac{m_g}{m_g + m_l}$$

$$v = xv_g + (1 - x)v_l$$
